

**The Legacy e-MERLIN Multi-Band Imaging of Nearby Galaxies Survey - results**

**Rob Beswick**

On behalf of the LeMMINGs  
e-MERLIN Legacy team.

*e* **MERLIN**

# Outline

---

e-MERLIN (& LeMMINGs) – background & capabilities

Highlights of results

The future – what next??

# e-MERLIN

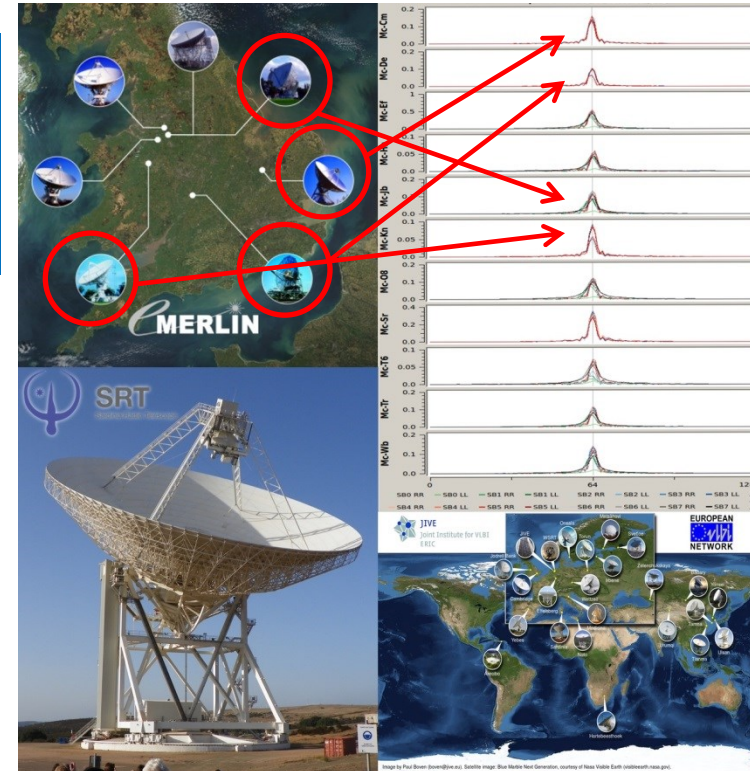

e-MERLIN (SKA-pathfinder)  
operating at cm- $\lambda$  with  $\mu$ Jy  
sensitivity and  $\sim 10$ - $220$ km  
baselines

Key/integral part of the EVN  
- providing 'short' spacing baselines  
- Now becoming fully integrated

# e-MERLIN & EVN

First science eEVN + e-MERLIN + SRT run  
(18/19<sup>th</sup> Sept 2018)  
- 4 e-MERLIN stations (CM, KN, DE, & MK2)

Key/integral part of the EVN  
- providing 'short' spacing baselines  
- **Now** becoming fully integrated

# e-MERLIN Proposal deadline

## **PATT proposals** (aka PI-led proposals of all sizes)

- 6 monthly call cycle (spring/Autumn) – fully open
- Proposals accepted via Northstar proposals system

See [www.e-merlin.man.ac.uk/observe/](http://www.e-merlin.man.ac.uk/observe/)

- Online Simulator tools and exposure calculators available from e-MERLIN website
- Any use questions : [e-merlin@jb.man.ac.uk](mailto:e-merlin@jb.man.ac.uk)

Typical oversubscription rates are

- 4-3:1 (all proposals)
- 8-5:1 (proposals requesting Lovell telescope inclusion)

**NEXT OPEN PATT DEADLINE:**

**15<sup>th</sup> November 2018 –**

**23:59:19 UTC**

See call at [www.e-merlin.ac.uk](http://www.e-merlin.ac.uk) – or speak to any e-MERLIN person here this week for info.

# The e-MERLIN Legacy project : LeMMINGs

(a. k. a :

**Legacy e-MERLIN Multi-band Imaging of Nearby Galaxies)**

Rob Beswick (JBCA/e-MERLIN)

Ian McHardy (Southampton)

Plus the whole LeMMINGs

e-MERLIN Legacy team

Extra special mention to the key people that have **really** done the  
work:

**Raneri Baldi, David Williams, Jonathan  
Westcott, Megan Argo, Bil Dullo**

# Original LeMMINGs Science case

---

- Basic premise of survey is to
  - Image a complete (representative) sample of nearby galaxies, encompassing all galaxy types, at sub-arcsecond angular resolutions and microJansky sensitivities. Multi- $\lambda$  follow-up. Provide a public legacy data-set.
- Built around three Core science themes:
  1. Measure star-formation activity and star-formation.
  2. Make a complete census of AGN activity and jet structures in galaxies
  3. A serendipitous parsec-scale imaging survey of the cold ISM via HI absorption and maser emission.
- 2-tiered approach to image  $\sim 300$  galaxies. Majority via snapshot imaging plus a smaller deep sample.

Updated for reality

# On-going LeMMINGs Science case

Basic premise of survey is to

- Image a complete (representative) sample of nearby galaxies, encompassing all galaxy types, at sub-arcsecond angular resolutions and microJansky sensitivities. Multi- $\lambda$  follow-up. Provide a public legacy data-set.

On-going process working well  
- lots coming!!!

- Built around three Core science themes:

- Measure star-formation activity and star-formation.

FIRST results DR1

- Make a complete census of AGN activity and jet structures in galaxies

FIRST results DR1

- A serendipitous parsec-scale imaging survey of the cold ISM via HI absorption and maser emission.

- coming soon

- 2-tiered approach to image  $\sim 300$  galaxies. Majority via snapshot imaging plus a smaller deep sample.

Results DR1 (1/3 statistical sample), lots of single gal. results (Deep tier)!

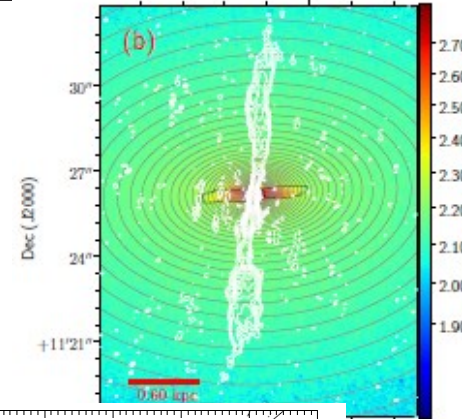

# Two tier approach – Results thus far..

- Deep 'targeted' tier  
Multiple 'single-source' papers from deep tier programme + usage of data in other projects.. (incomplete selection)

- Westcott et al 2016 MNRAS, - IC10
- Dullo et al 2018 MNRAS- NGC5322
- Williams et al 2017, MNRAS – NGC4151
- Ramparadarth et al 2018, MNRAS
- Williams et al, 2018, MNRAS – NGC6217
- Westcott et al 2018, MNRAS – NGC1569..
- Plus multiple papers associated or using LeMMINGs data

- Shallow 'statistical' tier - 280 gals sample
  - LeMMINGs Shallow paper#1 --  
LEM#1 Baldi et al 2018, MNRAS (45pp!).  
LEM#2 – Williams et al (radio, X-ray)

# Samples

---

## 1) *Shallow(ish)* Sample = **Palomar bright galaxy sample**

- Well selected sample of nearby galaxies (Ho ++ 1995)
- Optical selected (NO radio bias),  $B_T < 12.5$  mag
- All galaxy types : Active (Seyfert, LINER), non-active (HII, Absorption line gals)
- Total sample 280 galaxies, following applying a declination cut ( $> +20$ deg)
  - Median distance = 20Mpc
- Strong multi-wavelength coverage ... both pre-existing and being compiled.
  - Complete HST, Spitzer and (near complete) Herschel
  - Almost complete Chandra imaging (with Associated LeMMING large programme approved to fill gaps)
  - Complete JVLA imaging (L + C-band), and selected sub-sample at 15GHz.

Project Core – e-MERLIN '*shallow*' snapshot imaging survey of whole sample. (1.5GHz – complete, 5-7GHz pending)

2) *Deep* Sample = small number selected targets of interest at L & C-band with observations  $\sim 10$  times deeper than shallow tier

# LeMMINGs #1 – shallow (results Baldi et al 2018)

---

- Results release 1 (103 targets - snapshot)
  - image rms  $\sim 70\mu\text{Jy/bm}$  @ 150mas ang res @ 1.5GHz
  - ‘Core region search only’ – inner 1arcmin only
  - 47/103 ( $\sim 46\%$ ) detection rate at  $F > 0.2\text{mJy}$

Fractions by type:

1. LINER:	22/34	→ 65%	} Active
2. Seyfert:	4/4	→ 100%	
3. HII:	16/51	→ 31%	} Inactive
4. Absorption line gals:	5/14	→ 36%	

# Depth and detection rates

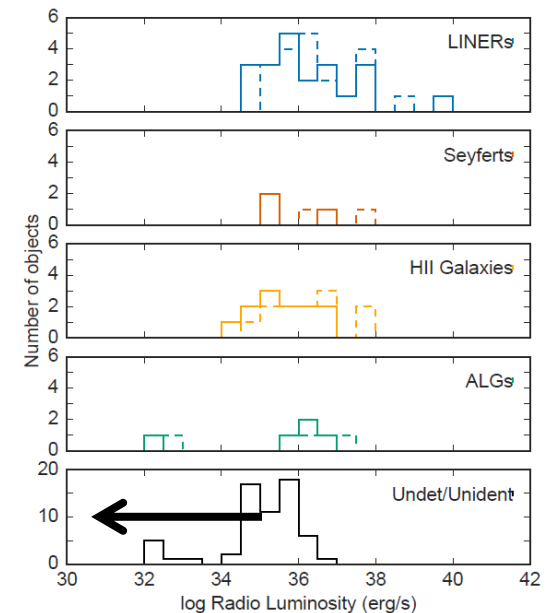

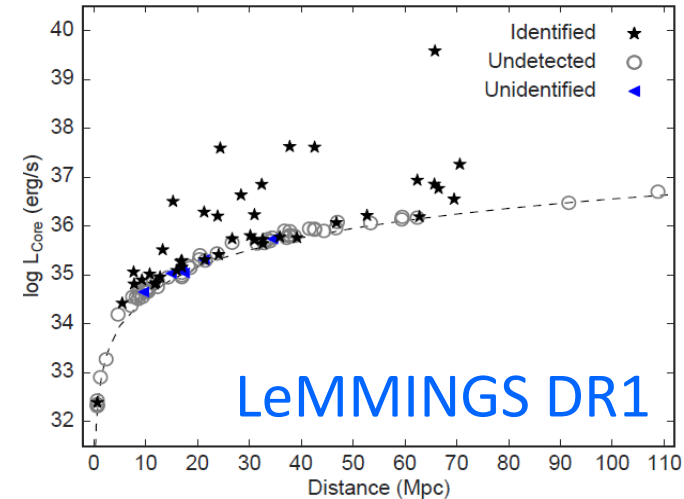

Typical core  $L_{\text{core}} \sim 10^{32} - 10^{40}$  erg/s  
(ie.  $\sim 100$  Sgr A\* at L-band  
C-band will be  $\sim 10 \times$  Sgr A\*)

Survey depth  $> 10$  deeper than  
previous surveys (e.g. Nagar+,  
Filho+)

Optical source classification via BPT

Detection fraction follow  $M_{\text{BH}}$

Jetted structures in sources  $> 10^6 M_{\odot}$

# Typical images

Full resolution

Single core  
NGC5353

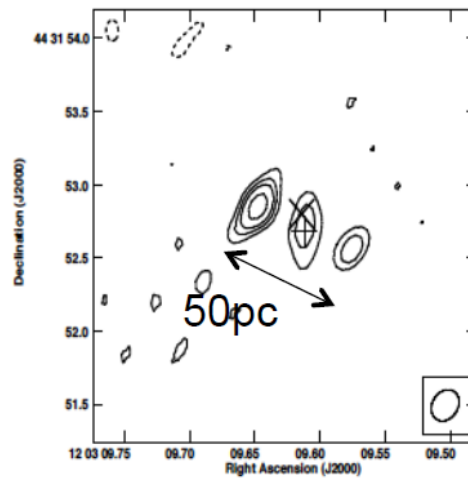

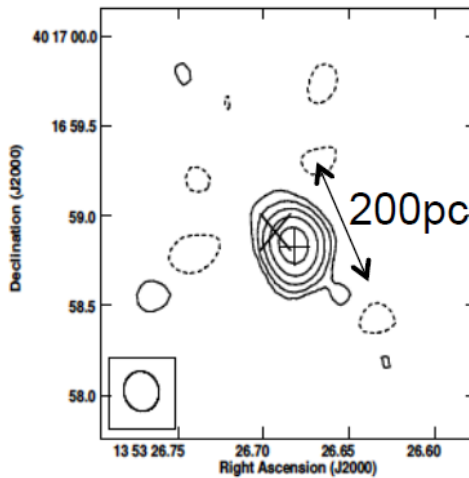

Triple source  
NGC4051

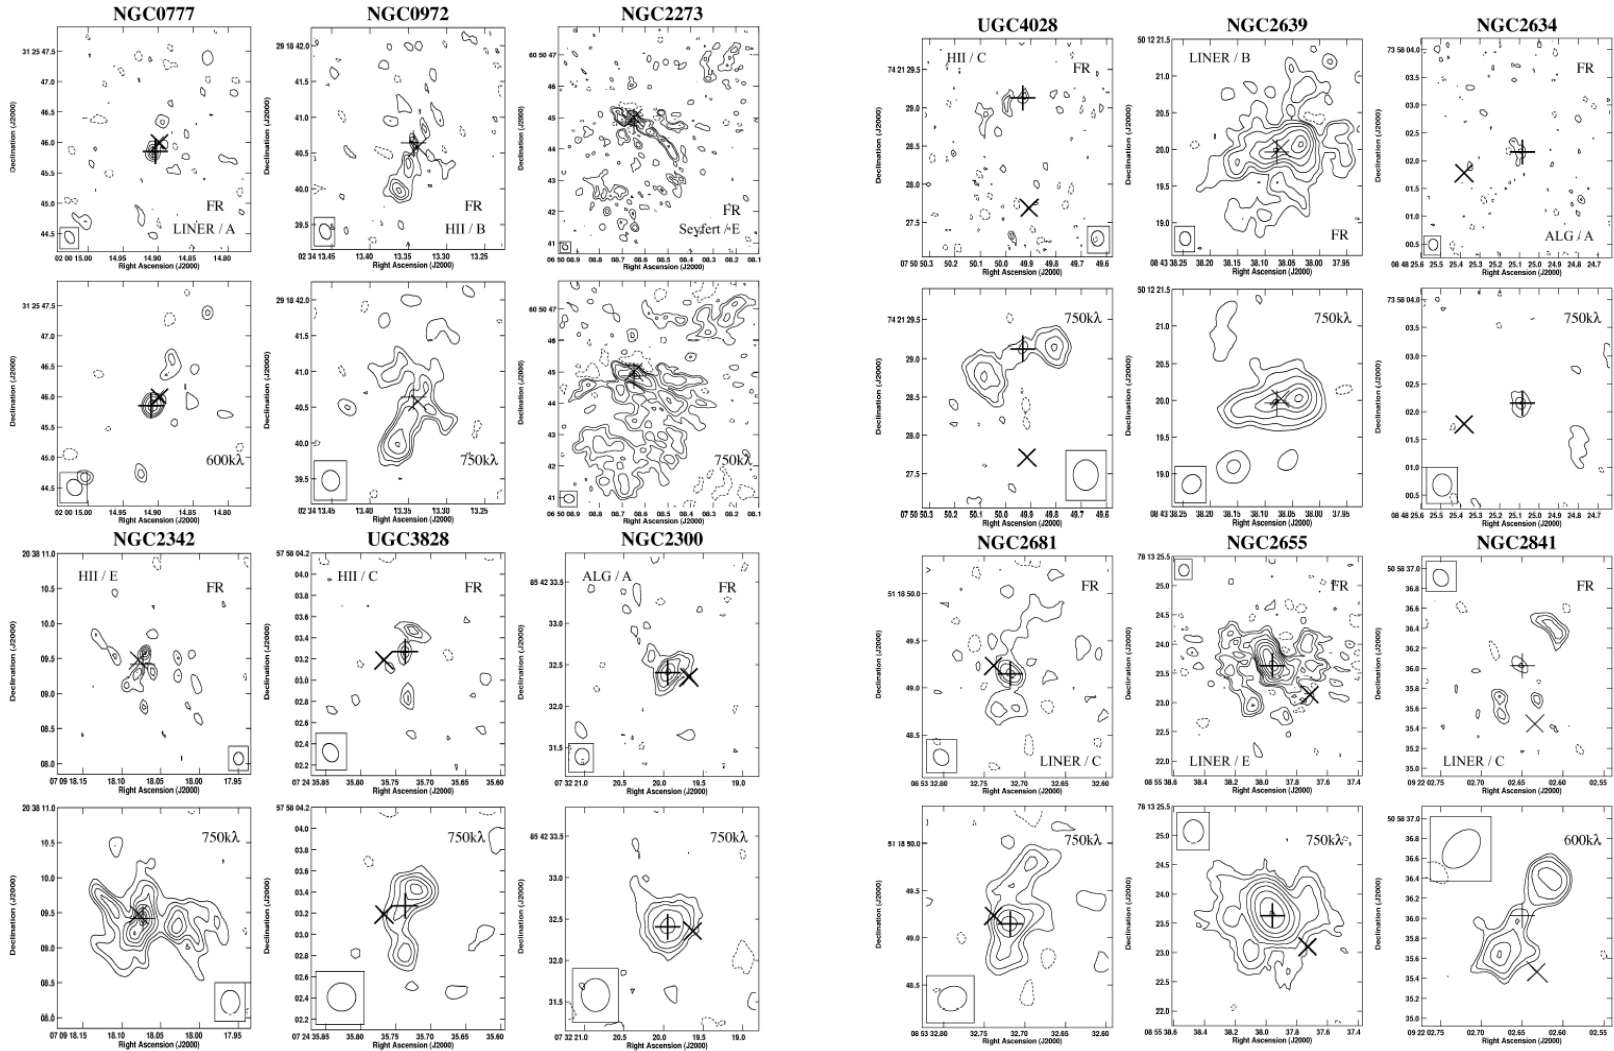

Double jet  
NGC2681

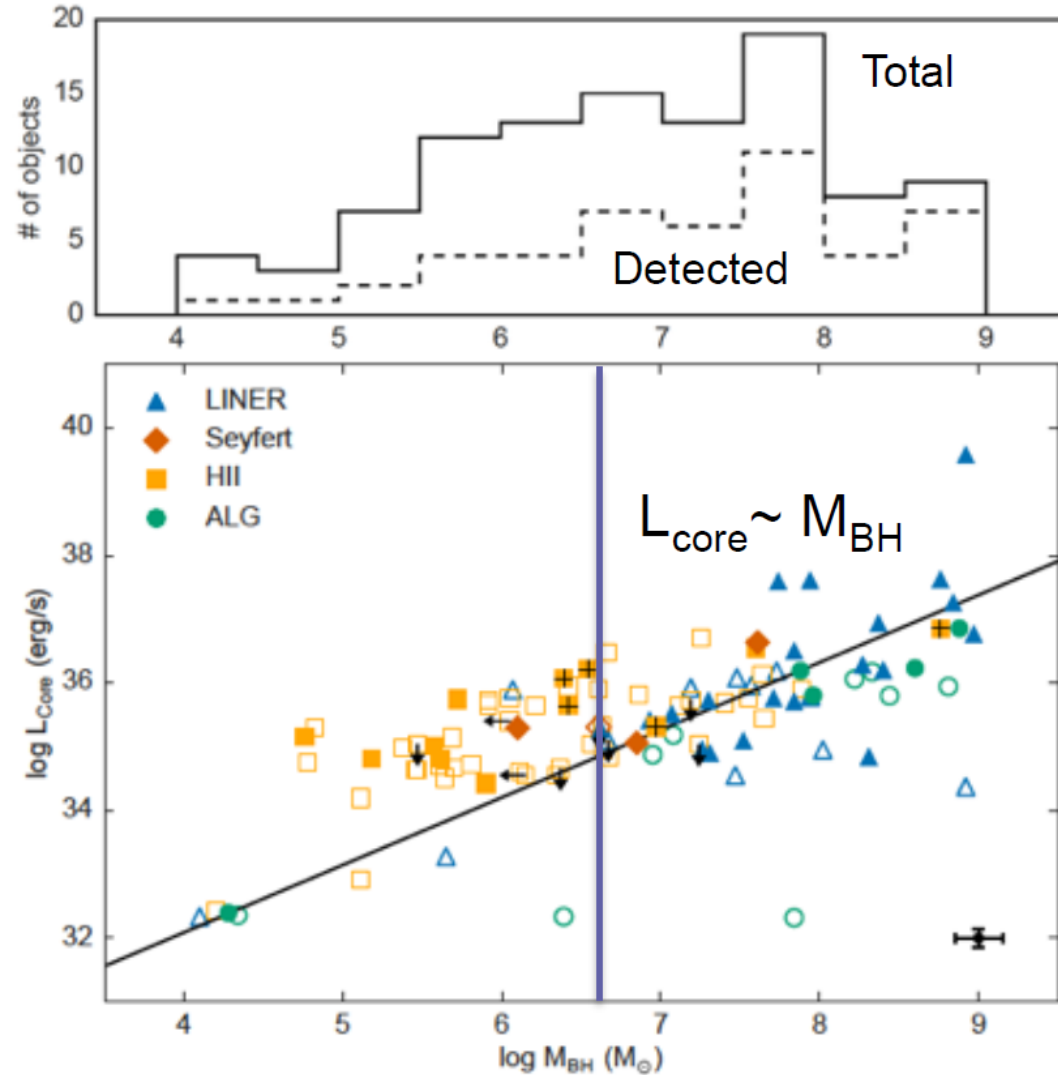

Low resolution

# Images

# Radio – BH Mass

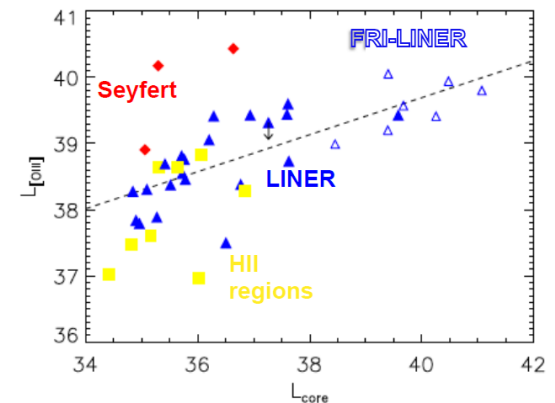

Detection fraction Propto  $M_{BH}$

For  $M_{BH} > 10^{6.5} M_{\odot}$

$$L_{core} \sim M_{BH}$$

Break below  $10^{6.5} M_{BH}$   
(Greater proportion of SF emission)

Hierarchical evolution  
+ SF

# Conclusions

---

- Nearby galaxy surveys with e-MERLIN are well suited to LLAGN, jets and SF on small scales.
- LeMMINGs survey first DR1 (103 gals) now available
  - Deepest survey high-res survey
  - Pc-scale radio emission to BH  $\sim 10^6 M_{\odot}$
  - Lots more to come – Deep LeMMINGs survey producing wealth of results.
  - More shallow survey ( $\sim 180$  more galaxies) C/L-band imaging
- Deep tier programme continues on smaller sample but at  $\mu\text{Jy/bm}$  sensitivities

Next stages of data releases

- Full sample (280 gals) including Ancillary data :

HST imaging, Spitzer, Herschel, new Chandra imaging, new JVLA (1.5, 5 and 15GHz) ++ etc

All to be released with the complete DR1 data set from e-MERLIN..

# Special thanks

---

**All credit to:** Wider LeMMINGs team how have done all the hard work.

But especially

- David Williams (Soton, PhD -> Now PDRA Oxford)
- Jonathan Westcott (Herts, PhD → Soon PDRA at Herts)
- Raneri Baldi, Megan Argo, Bil Dullo
  
- Plus all of the other LeMMINGs core team members!
